

Project

Project Initialization and Planning Phase

Date	1 July 2026
Team ID	
Project Name	Rising Waters: A Machine Learning Approach to Flood Prediction
Maximum Marks	3 Marks

Define Problem Statements (Customer Problem Statement Template):

Create a problem statement to understand your customer's point of view. The Customer Problem Statement template helps you focus on what matters to create experiences people will love. A well-articulated customer problem statement allows you and your team to find the ideal solution for your customers' challenges. Throughout the process, you'll also be able to empathize with your customers, which helps you better understand how they perceive your product or service.

Problem Statement (PS)	I am (Customer)	I'm trying to	But	Because	Which makes me feel
PS-1	A meteorologist responsible for issuing flood warnings.	predict flood risk accurately and in time to alert authorities.	conventional forecasting methods often flag risk too late.	the system relies on manual analysis of scattered rainfall data with no automated model.	anxious about missing the window to warn at-risk communities.
PS-2	A disaster relief coordinator managing multiple flood-prone regions.	monitor flood risk across several districts at once during monsoon season.	there is no single tool that classifies risk region by region in real time.	resources have to be allocated based on incomplete or delayed information.	overwhelmed and uncertain about where to prioritise relief efforts.
PS-3	A government analyst evaluating disaster-preparedness systems.	validate that a flood prediction model is accurate enough for operational use.	existing models are rarely tested transparently against historical flood data.	there is no accessible way to compare model accuracy across algorithms.	cautious about trusting a system without proven, measurable performance.
