

Empathy Map

Date	1 July 2026
Team ID	
Project Name	Rising Waters: A Machine Learning Approach to Flood Prediction
Maximum Marks	4 Marks

Empathy Map

Create an empathy map to understand your customer/user from four perspectives - what they Say, Think, Do, and Feel - in relation to the problem your project addresses. This helps the team build a customer-centric solution.

SAYS • “We need flood warnings hours in advance, not after the water has already risen.” • “Our current forecasting reports are too generic for specific districts.” • “Give me a simple dashboard, not raw rainfall numbers.”		THINKS • Is this prediction accurate enough to trust with people's lives? • How can I monitor several flood-prone regions at once? • False alarms could erode the public's trust in our warnings.
DOES • Manually cross-checks rainfall data from multiple sources before issuing alerts. • Coordinates with disaster relief teams to allocate resources during monsoon. • Reviews historical flood data to validate new prediction models.		FEELS • Anxious about a delayed or inaccurate warning costing lives. • Relieved when a reliable system flags risk early. • Overwhelmed managing multiple regions with limited tools.
